SCRIPT -CONTROLLED ACL RESTRICT RECORD

BASED ON FIELD VALUE

PHASE 3 – PROJECT DESIGN

1. System Design

The system is designed using ServiceNow to control access to records based on user roles and the Branch field. A custom Institution Details table is used to store the required student and faculty information.

2. Table Design

The Institution Details table contains the following fields:

- Student Roll Number
- Student Name
- Faculty Name
- Branch
- Email
- Phone Number
- Description

The Branch field contains ECE, EEE, and CSE values.

3. Role Design

Four custom roles are designed for different operations:

- bb1 – Read
- bb2 – Create
- bb3 – Write
- bb4 – Delete

4. ACL Design

ACLs are designed for Read, Create, Write, and Delete operations. The Read ACL uses the Branch condition to restrict access to EEE records, while the other ACLs control the corresponding record operations through roles.

5. Access Flow

User → Role Verification → ACL Check → Branch/Permission Check → Allow or Deny Access

6. Expected Design Outcome

The system design provides role-based and record-level access control, ensuring that users can perform only the operations permitted by their assigned roles.
