

PHASE 8 – PROJECT DEMONSTRATION PHASE

1. Introduction

The Project Demonstration Phase is the final phase of the project. In this phase, the completed Script Controlled ACL is demonstrated in the ServiceNow platform. The demonstration explains how record access is controlled based on a particular field value using an ACL script.

2. Project Title

Script Controlled ACL – Restrict Record Access Based on Field Value

3. Purpose of the Demonstration

The purpose of the demonstration is to show how a Script Controlled Access Control List (ACL) can be used to restrict access to ServiceNow records based on a field value.

The demonstration shows that:

The ACL checks the field value.

Access is granted when the required condition is satisfied.

Access is restricted when the condition is not satisfied.

Record-level security can be controlled dynamically using a script.

4. Demonstration Sequence

The demonstration is carried out in the following sequence:

Login to ServiceNow → Open ACL → Configure ACL → Add Script → Select/Test Records → Verify Access → Display Final Result

5. Steps

Step 1: Login to ServiceNow

Login to the ServiceNow instance using the authorized credentials.

Step 2: Open Access Control

Navigate to:

All → System Security → Access Control (ACL)

Step 3: Create/Open the ACL

Select the required table and choose the required operation, such as Read.

Step 4: Configure the ACL

Specify the required field and define the condition for accessing the record.

Step 5: Add the Script

A script is used to check the field value.

Step 6: Test the Record

Open records with different field values and check whether the user can access them.

Step 7: Verify Access

If the field value satisfies the condition → Access is allowed.

If the field value does not satisfy the condition → Access is restricted.

Step 8: Demonstrate the Result

Show the successful access restriction and explain how the ACL script controls the record.

6. Final Output

The Script Controlled ACL was successfully demonstrated in ServiceNow. The system checks the specified field value and controls record access according to the defined script condition.

Final Result:

The required records are accessible only when the specified field-value condition is satisfied, providing controlled and secure record access.
