SCRIPT -CONTROLLED ACL RESTRICT RECORD BASED ON FIELD VALUE

PHASE 1 – BRAINSTORMING & IDEATION

1. Problem Identification

Different users may require different levels of access to records. Providing the same access to all users may allow unauthorized users to view or modify records. Therefore, a mechanism is required to restrict record access based on user roles and field values.

2. Proposed Idea

The proposed system uses Script-Controlled Access Control Lists (ACLs) to restrict access to records based on the Branch field. EEE users can view only EEE branch records, while administrators have full access to all records.

3. Main Objectives

- Restrict record access based on field values.
- Control Read, Create, Write, and Delete operations using ACLs.
- Provide role-based access to users.
- Allow administrators to access all records.
- Implement record-level security.

4. Basic Project Idea

A custom Institution Details table is created to store student and faculty information. ACL rules are applied to control which users can view, create, edit, and delete records according to their assigned roles and branch.

5. Expected Outcome

The system should provide controlled and secure access to records. EEE users should be able to view only the permitted EEE records, while administrators should have full access to the records.
